

# Ergonomic Design Features of the BRAND® Transferpette® S Pipettes

from BrandTech® Scientific

Transferpette® S single and multichannel pipettes are modern, ergonomic pipettes designed to be easy to operate, while retaining the familiar central piston button design. All controls of the instrument are designed to be operated with small movements of a single hand, reducing the amount of manipulation required compared to other instruments.

## The Transferpette S features a 12.5mm piston stroke length

The Transferpette S features a 12.5mm piston stroke length – the shortest of all quality pipettes – to reduce thumb movement. Up to 40% shorter than some popular brand

## Volume adjustment brake

A volume adjustment brake can easily be operated by the thumb tip of the pipetting hand, to secure the volume setting from inadvertent drift.

## Right or left hand

Pipette is equally suited for use with left or right hands

## Volume adjustment

Smooth, thumb-tip volume adjustment, which can be secured or released with the brake.

## Finger hook

Finger “hook” along with a lightweight and well-balanced design reduces forces required to stabilize the pipette in the hand, resulting in a relaxed hand grip

## Stepped tip ejector

Stepped tip ejector (multi-channel models) dislodges tips two at a time, to spread out the forces required to eject tips.

## V-ring design

V-ring design (multichannel models) reduces forces required to mount the tips to get a good seal. Less mounting forces also mean less ejection forces.
